# Course Overview

Should You Only Take This Course If...

- ...you have the basics of ASP.NET/C#
- ...you've been exposed to ASP.NET MVC
- ...you have used a database before
- ...you want to learn best practices

# Course Overview

What This Course Will Teach You:

- How to design Entities
- Modeling in ASP.NET MVC
- Effective use of validation
- Working with models in Web API

# This Module

## Entities

## define: Entity

Something that exists in itself, actually or potentially, concretely or abstractly, physically or not that can be uniquely identified in some way.

# Entities are Nouns

Person

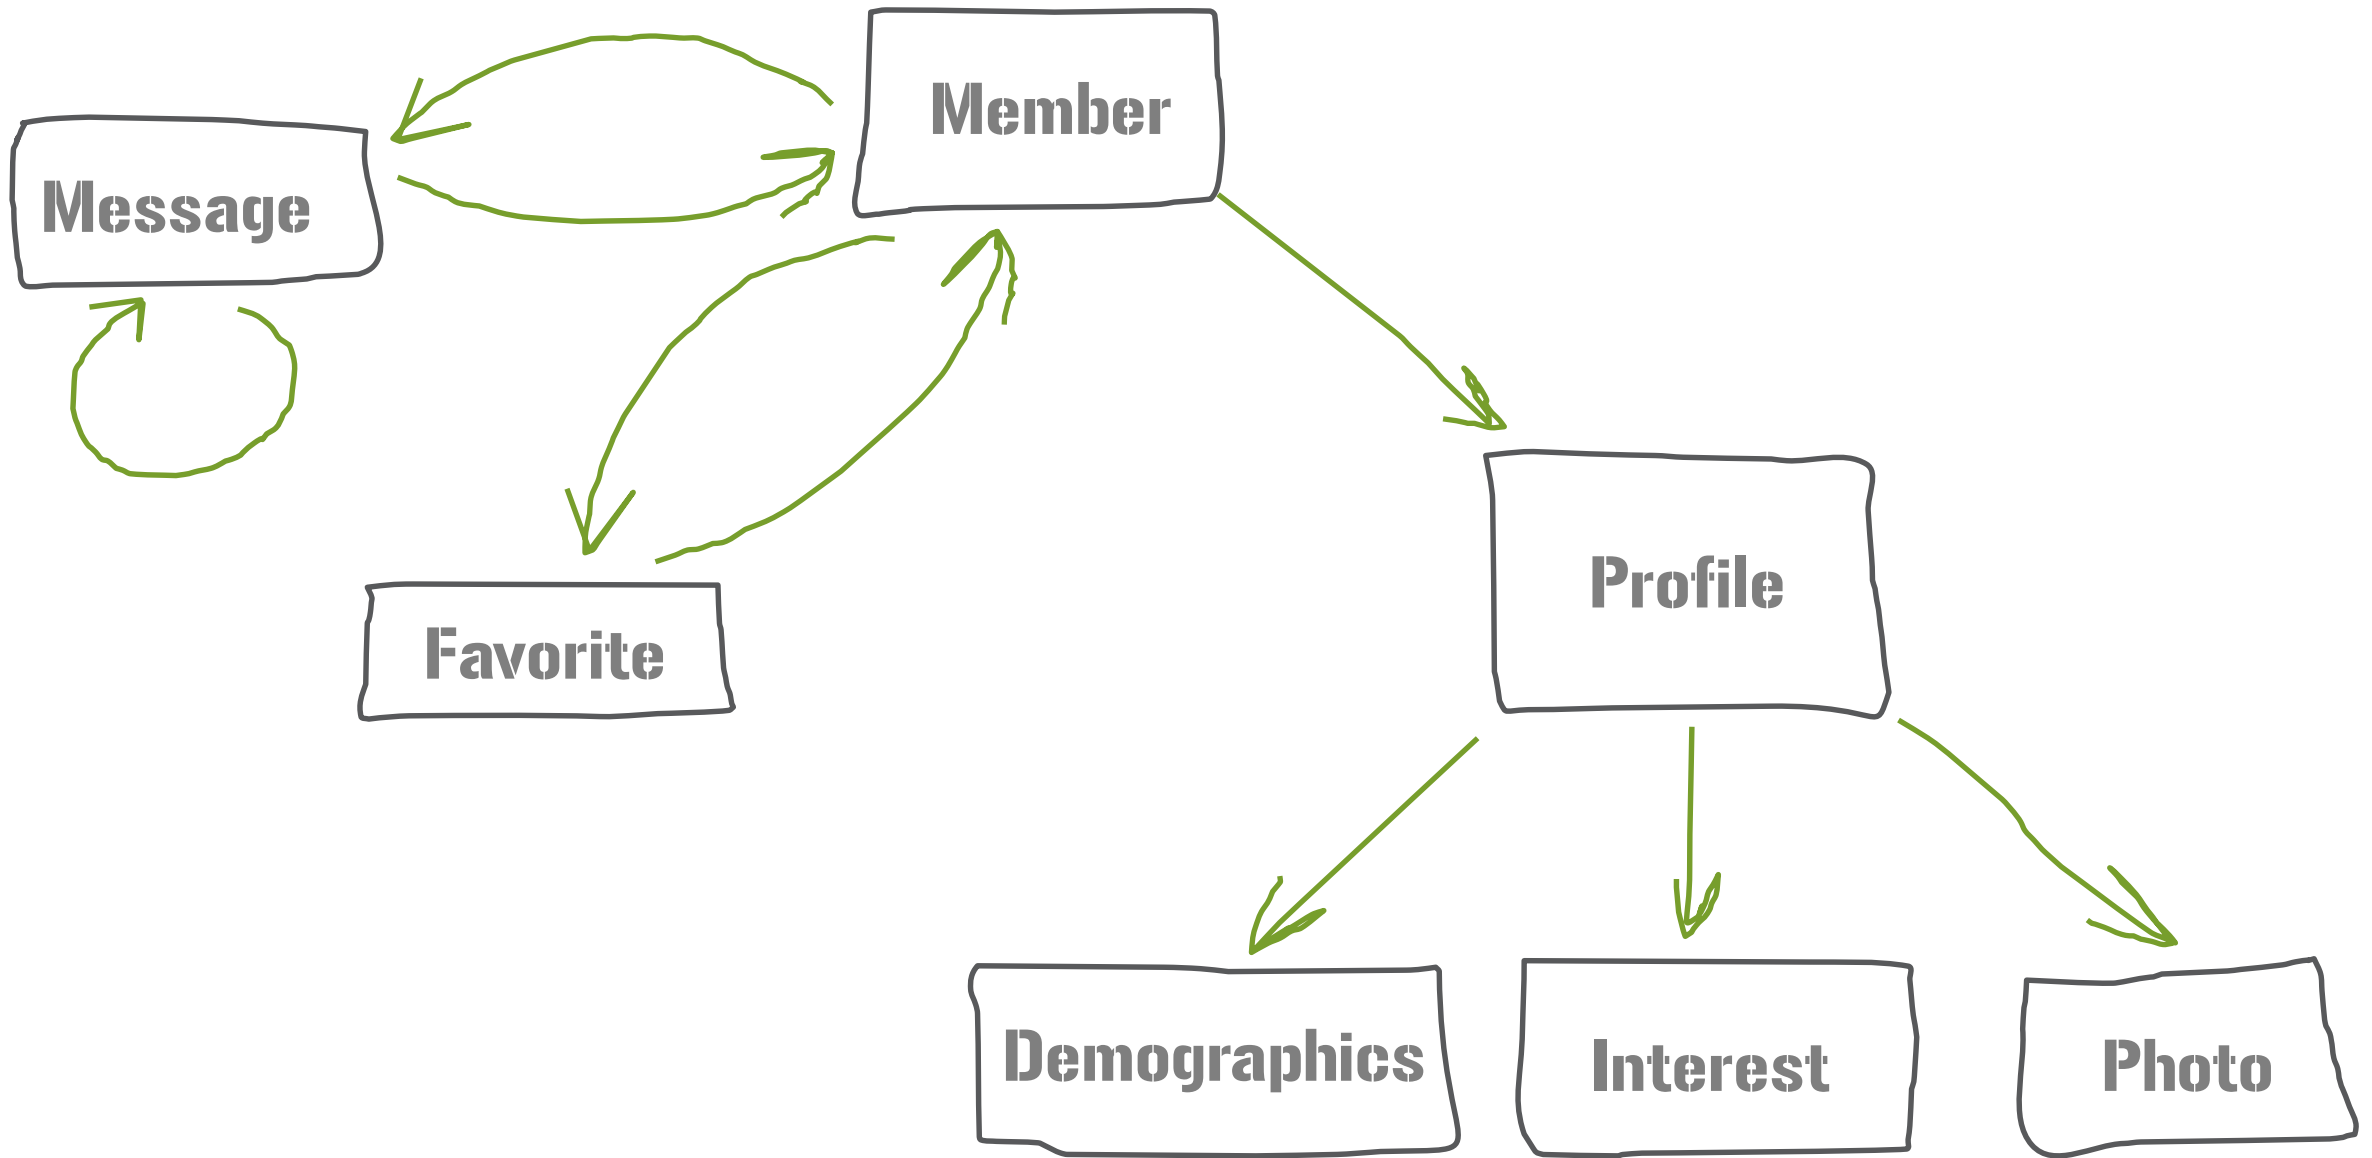

Vehicle

Invoice

Payment

Address

Product

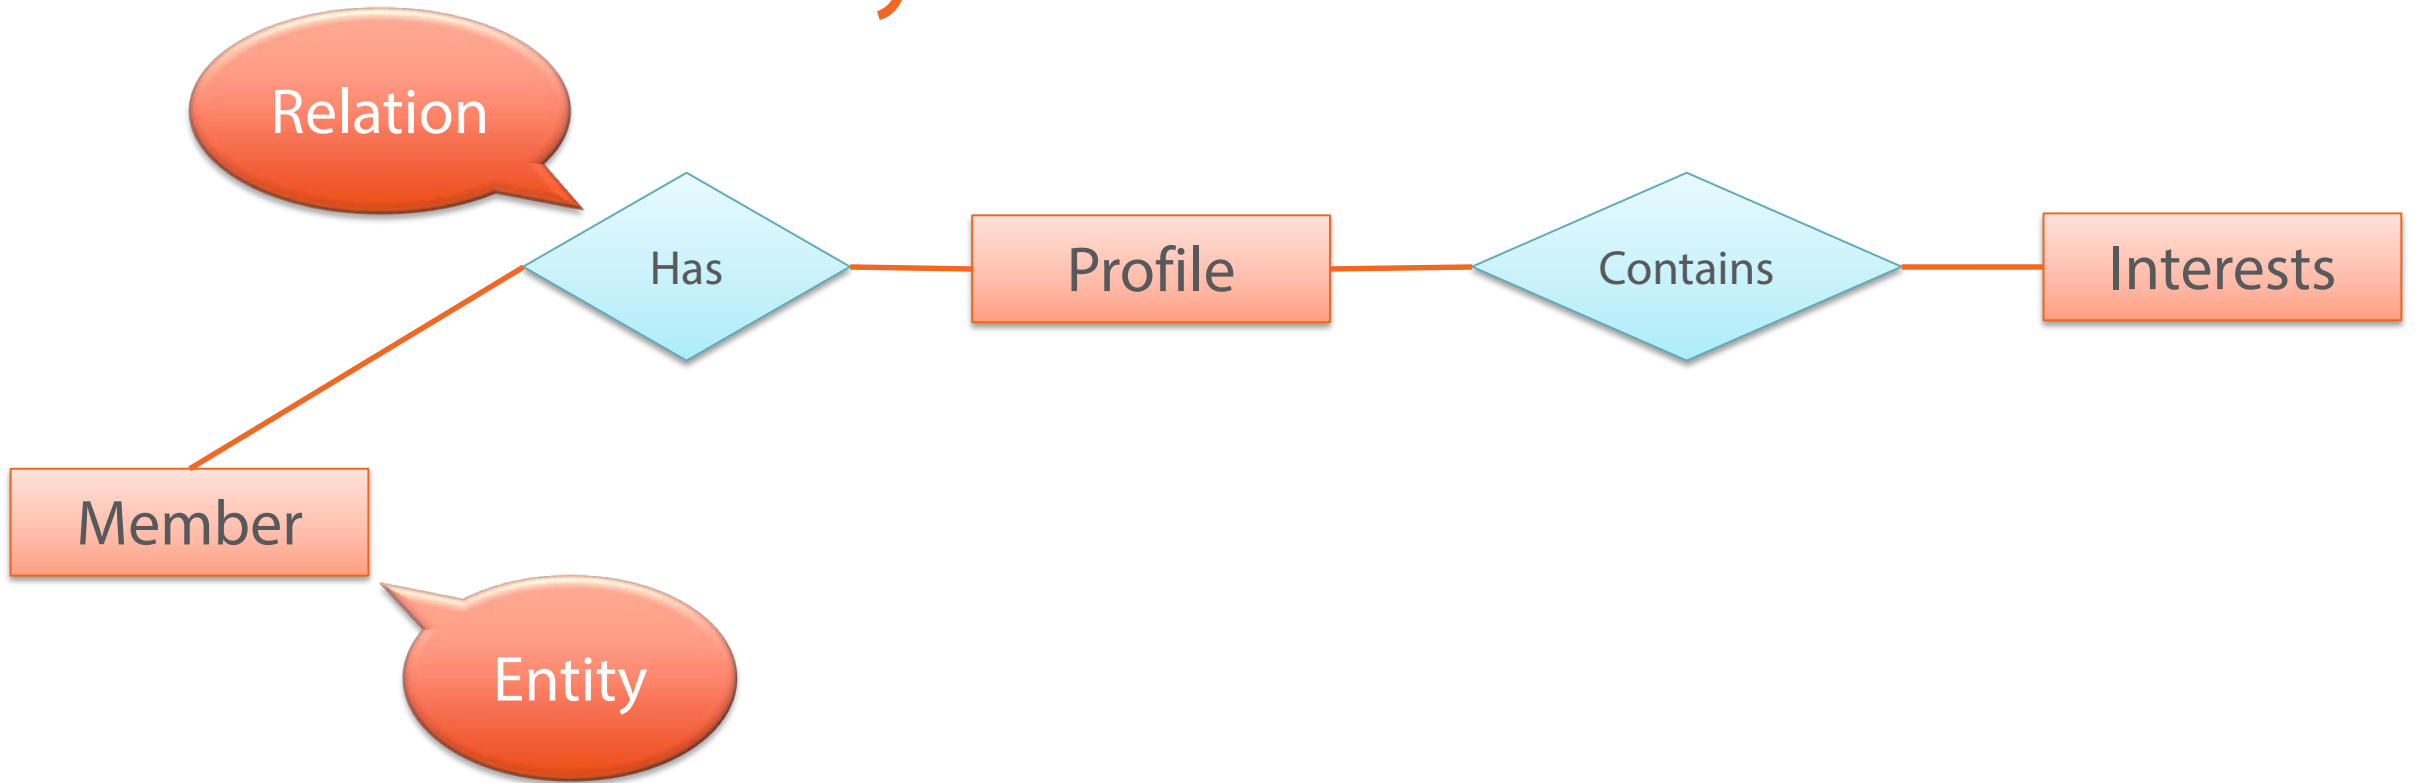

# Entity Relational Model

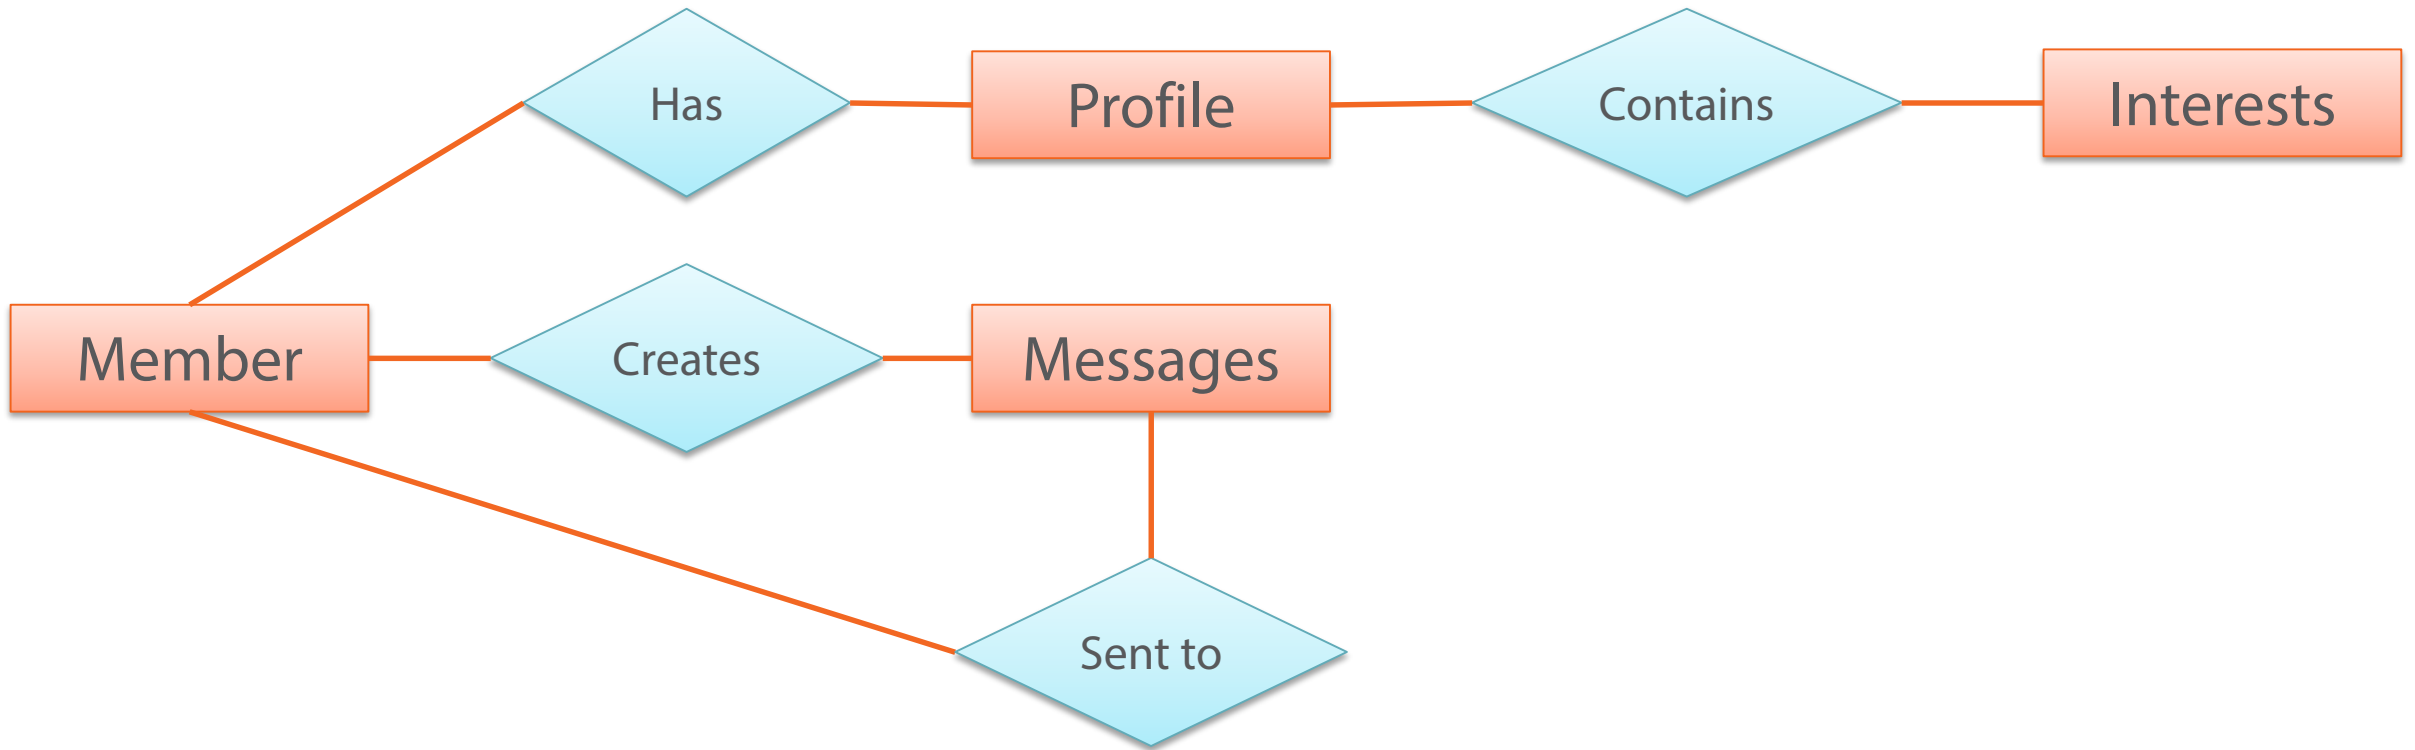

- Method for Describing Data or Information Needs
  - Allows you to abstractly describe your needs to facilitate storage
  - Gives you a core vocabulary for describing your data needs

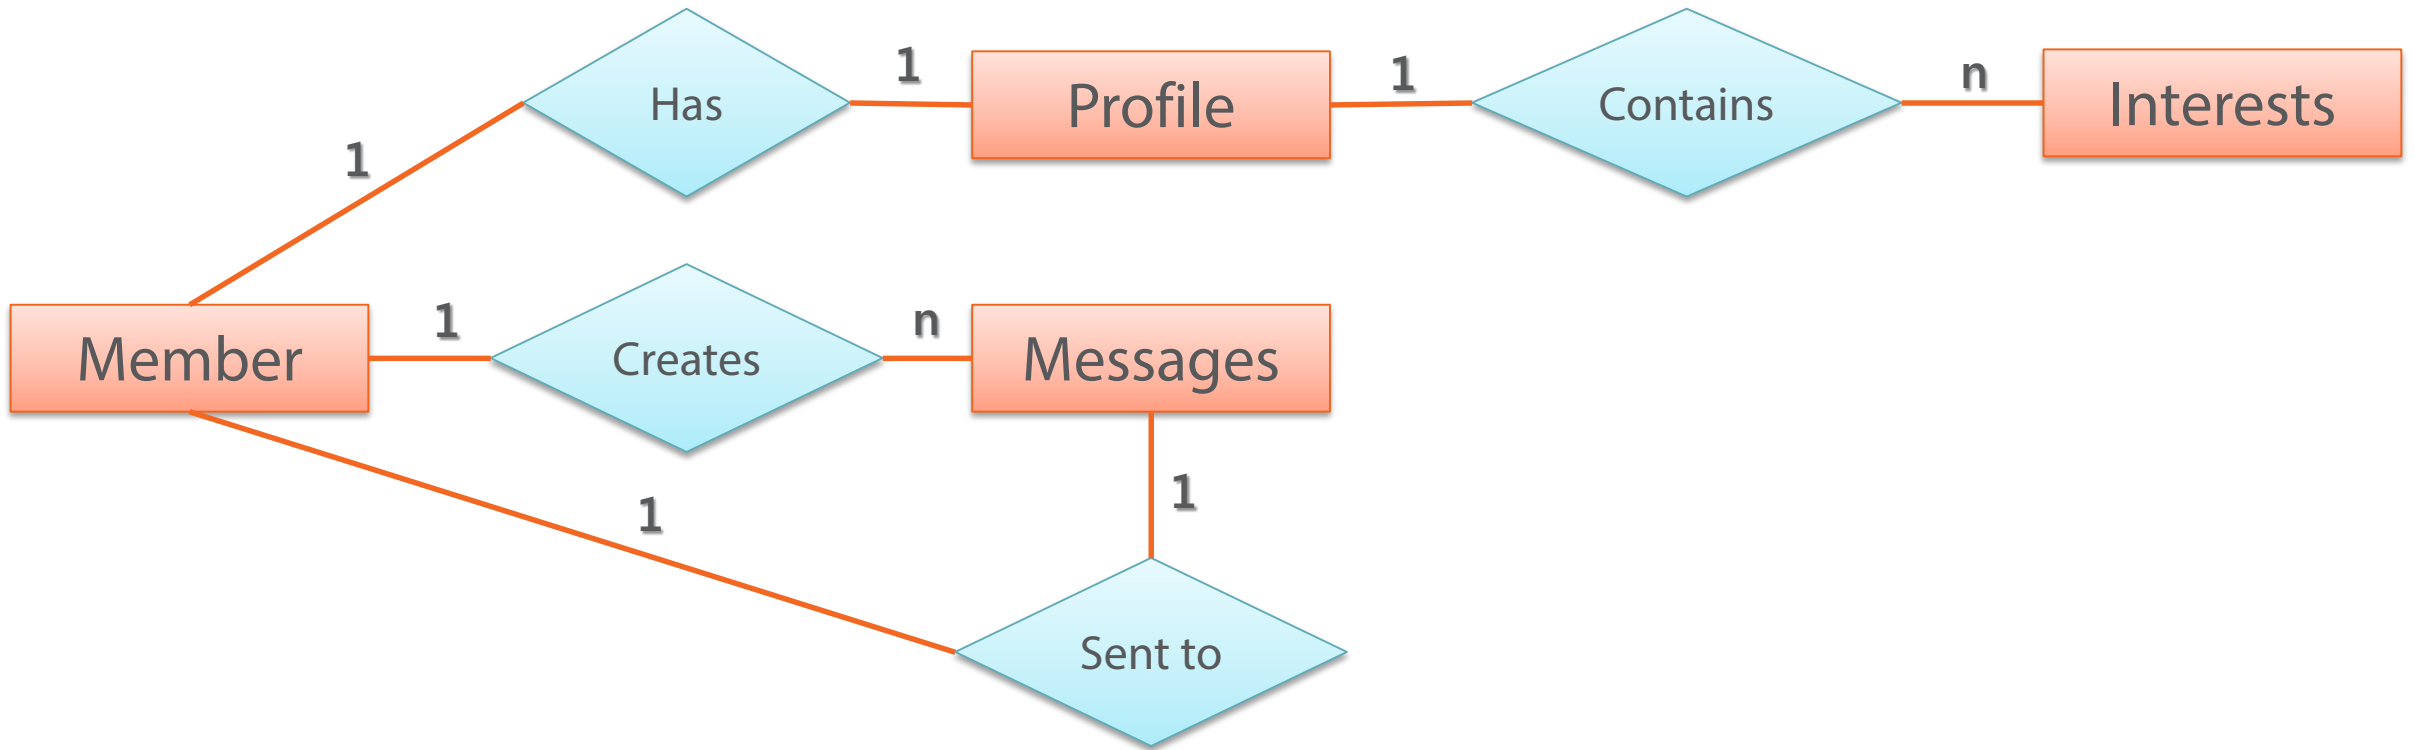

# Entity Relational Model

# Entity Relational Model

# Entity Relational Model

Entities require unique identification. That is what keys are for.

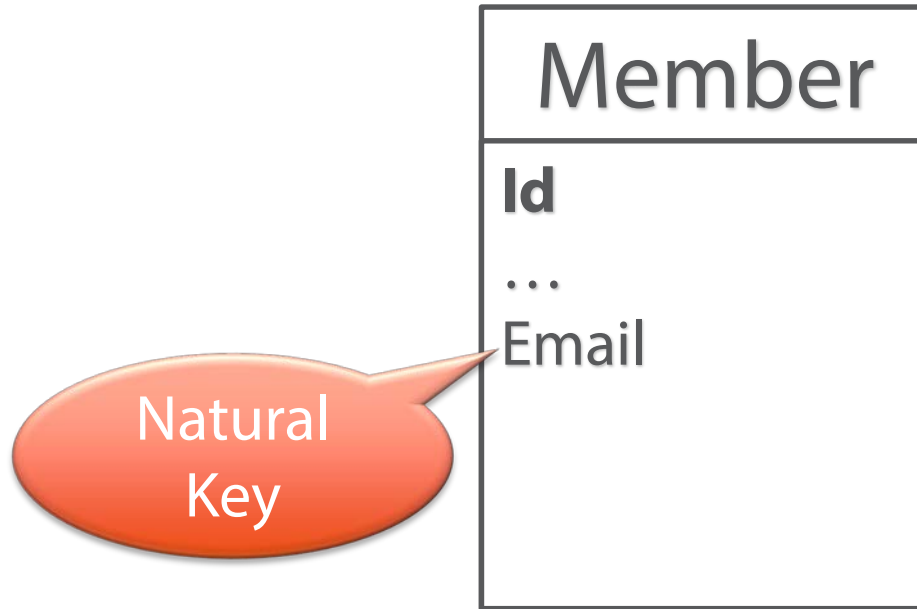

# Entity Keys

- Key Types
  - Primary Key: An attribute(s) that unique identifies the entity
  - Foreign Key: An attribute that connects two entities via a relation
  - Natural Key: An attribute that exists in the real world to identify an entity
    - E.g. Serial Number or Social Security Number

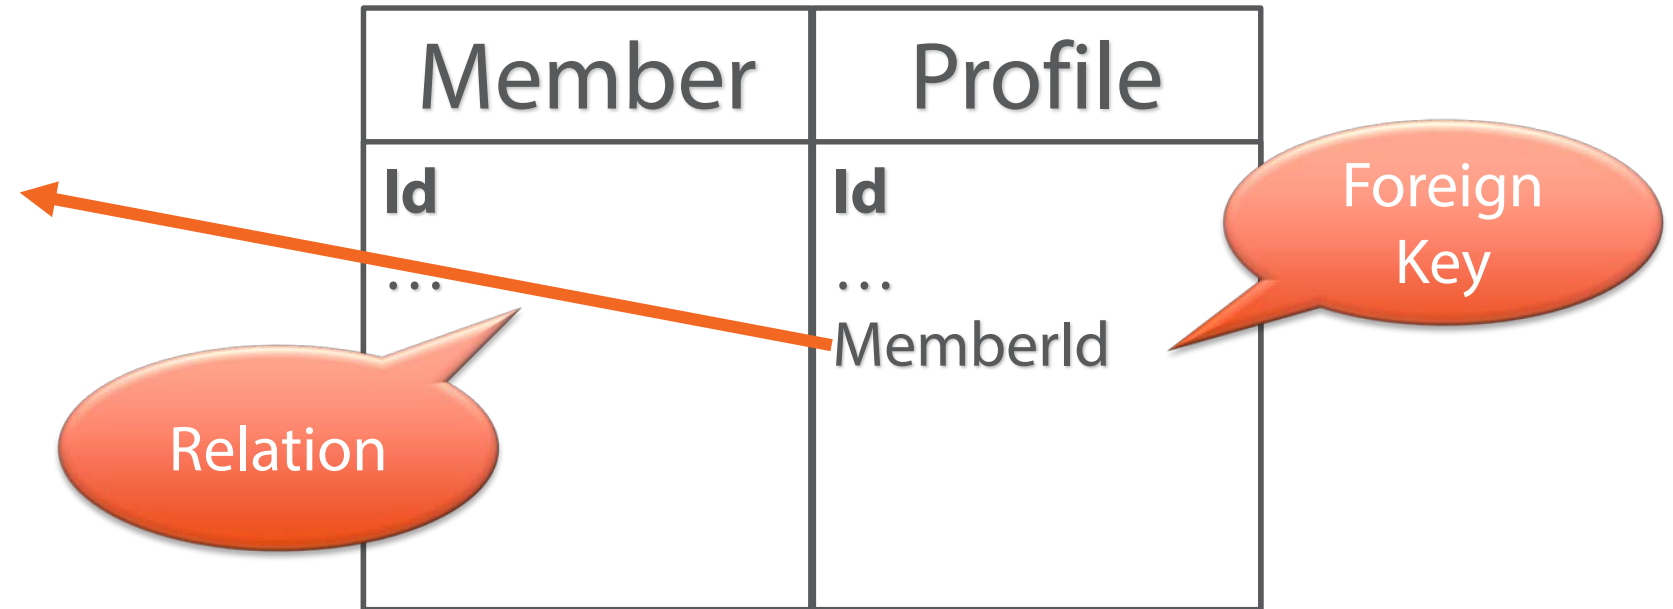

# Keys

# Keys

# Foreign Keys and Relations

# Foreign Keys and Relations

# Foreign Key or Containing Relationship?

# Attributes

Member
<b>Id</b>
FirstName
LastName
Birthdate
Gender

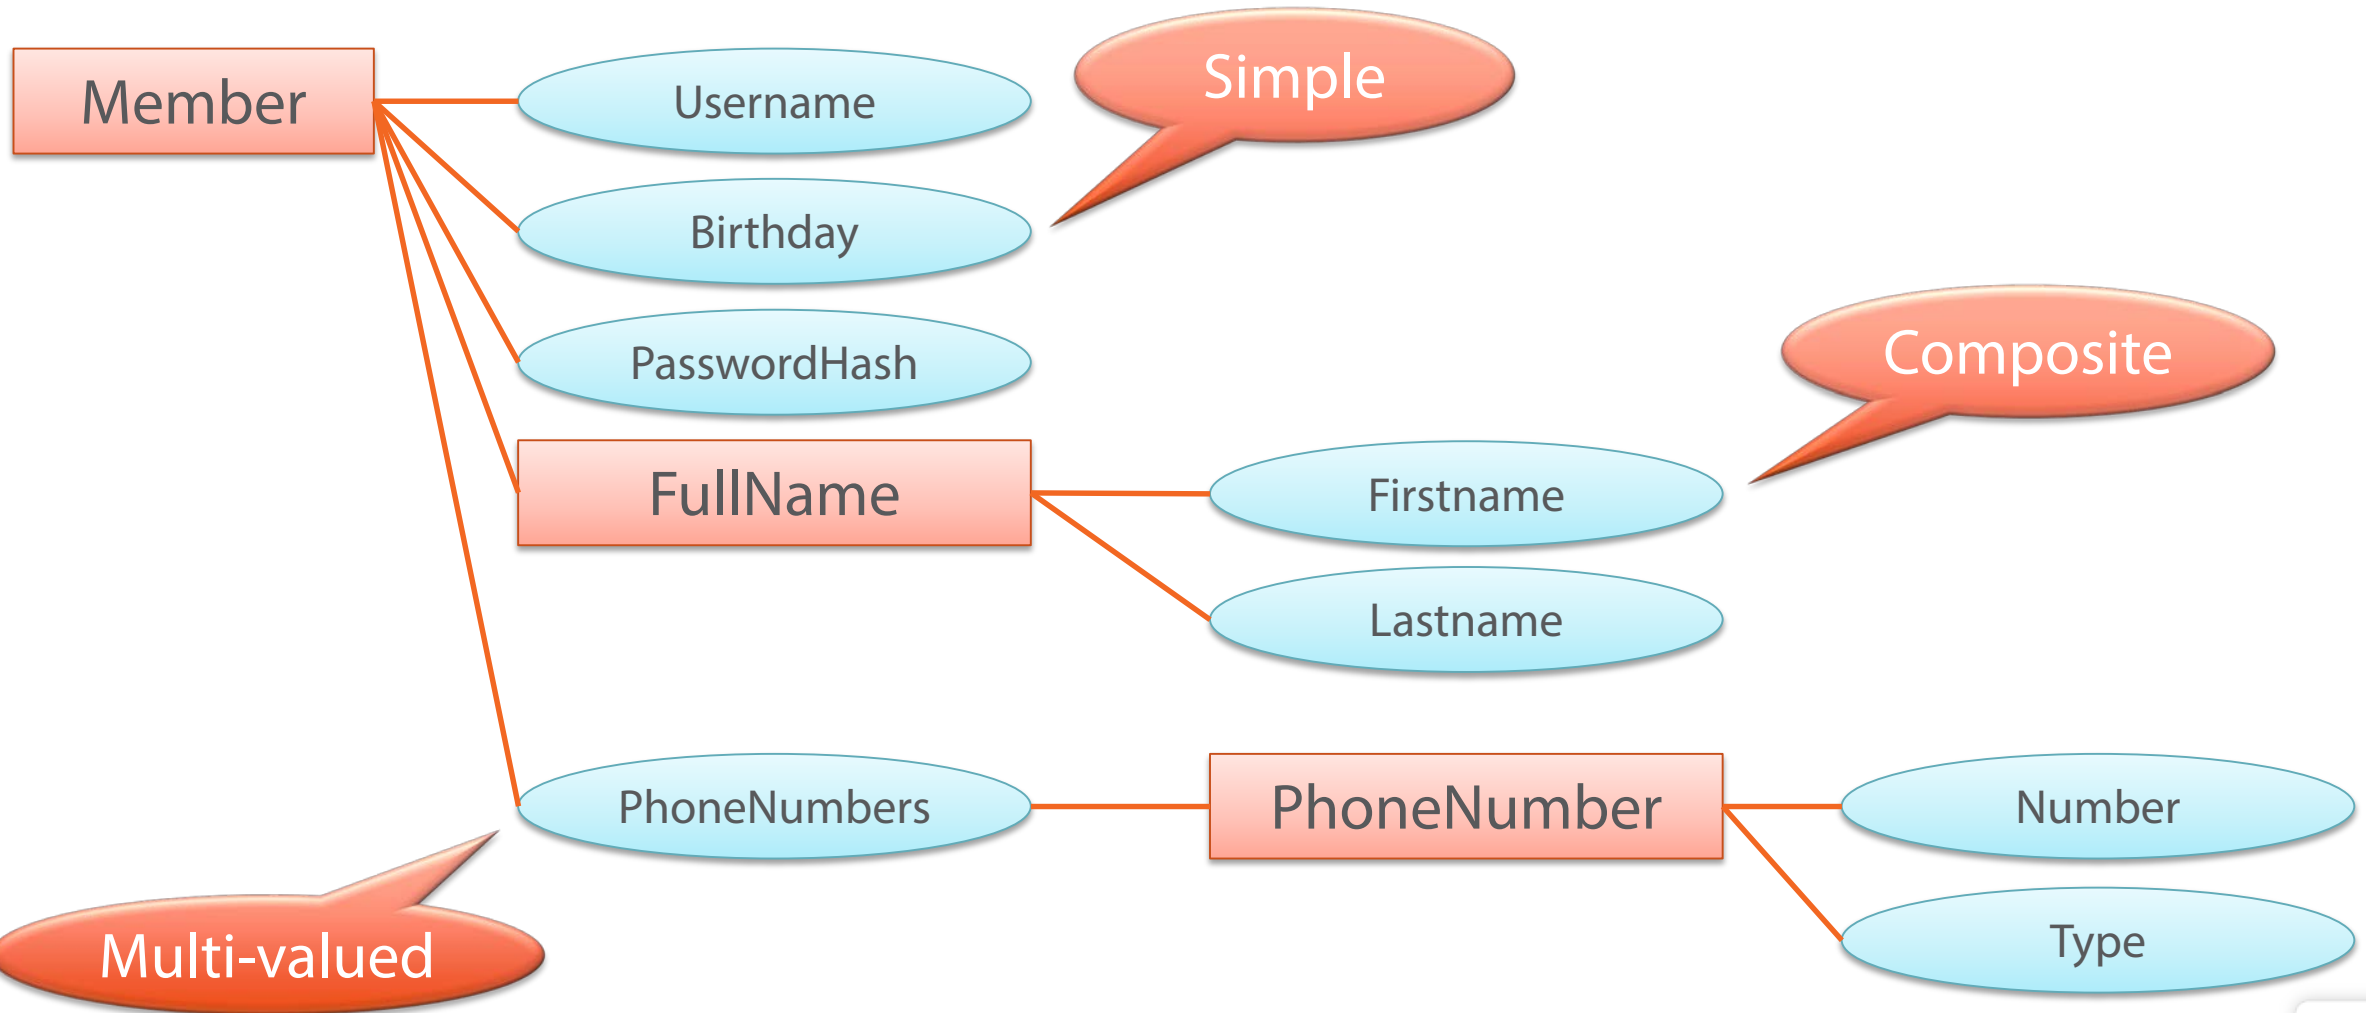

Attributes

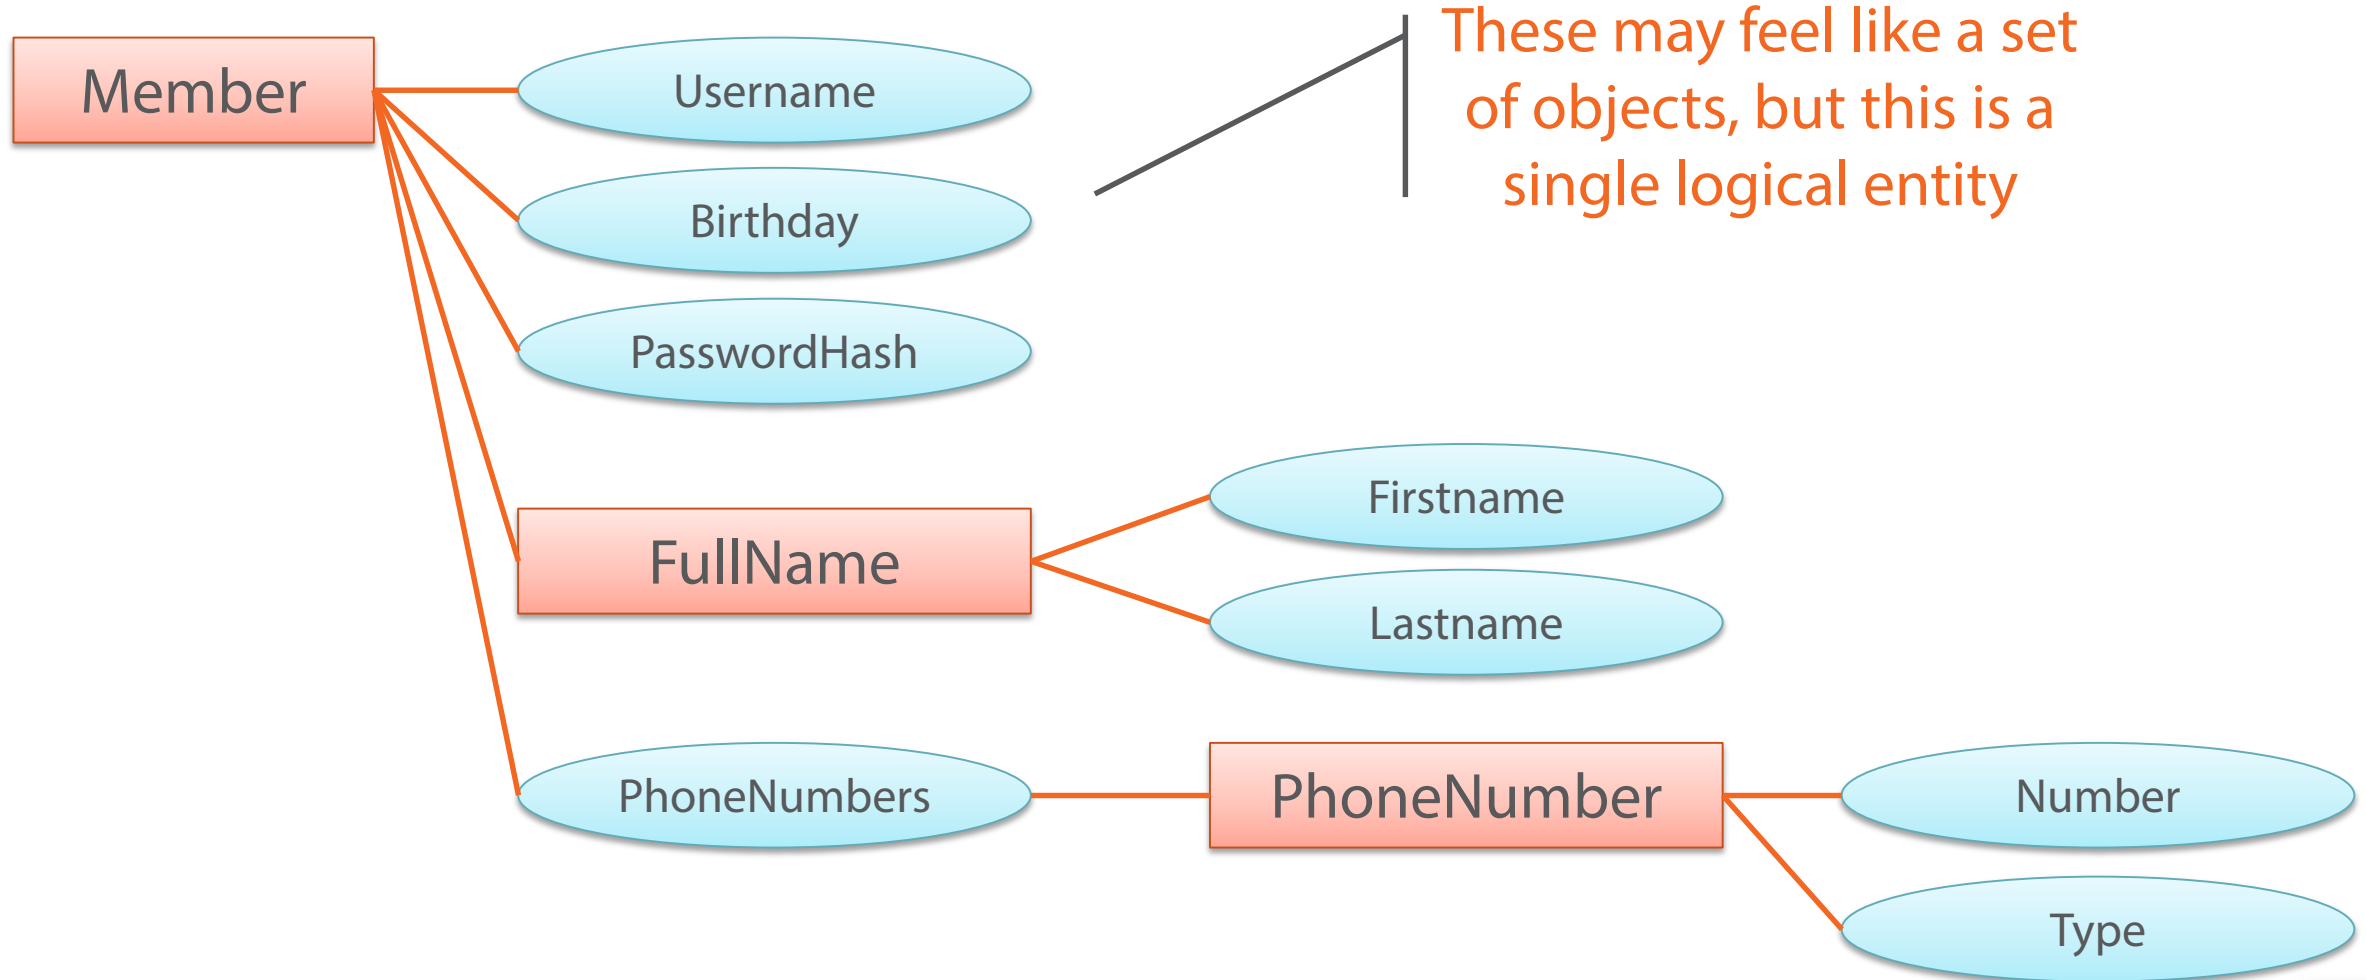

# Attribute Types

- Attributes can be modeled in different ways
  - Simple (e.g. birthday, last logged in)
  - Composite (e.g. address)
  - Multi-valued (e.g. phone numbers)

# Attribute Types

# Attribute Types

# Demo

Modeling

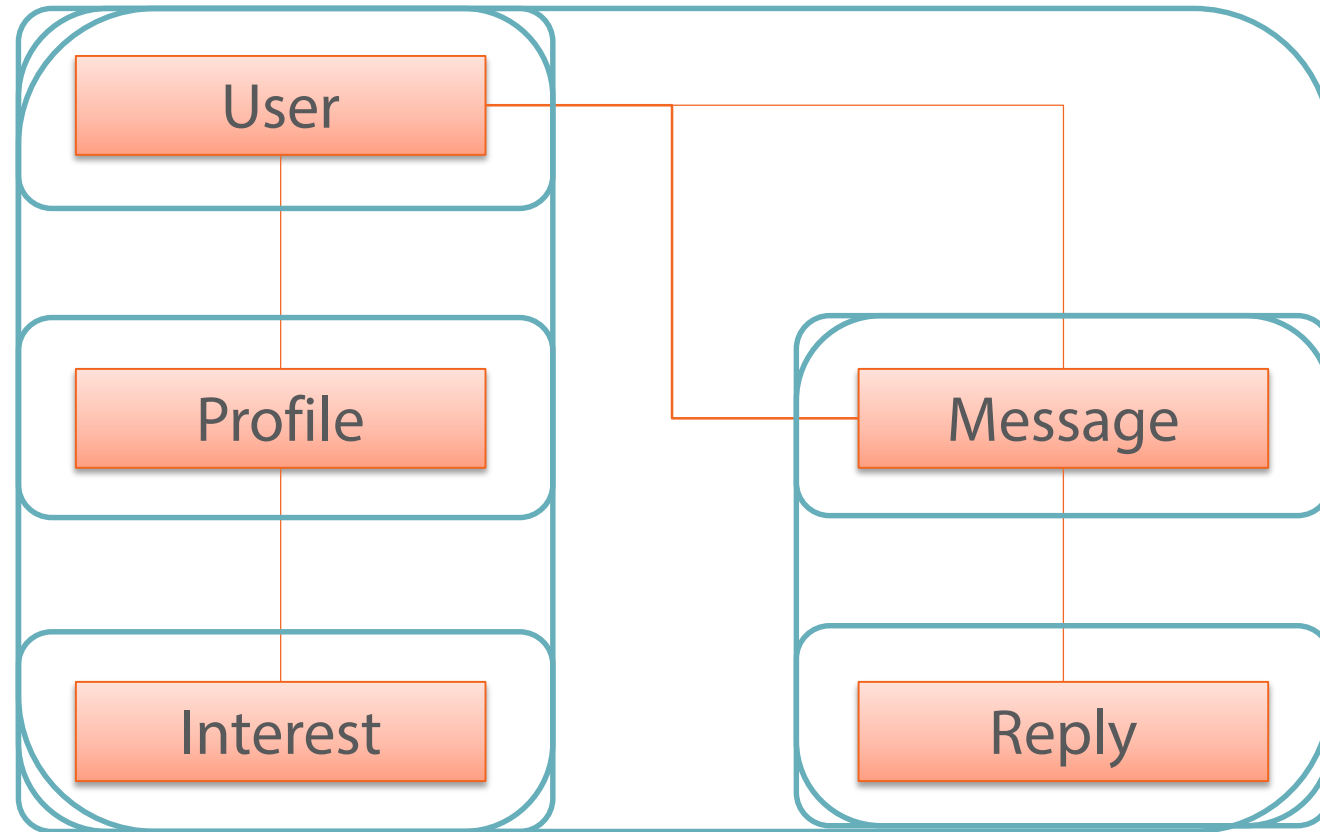

By Entities, we are not talking  
about Entity Framework.

# Persistence

- Out of the box, SQL Server and Entity Framework are used for persistence
  - But the design of your entities does not limit where you store them:
    - SQL Server
    - MongoDB (or other NoSQL Choices)
    - Flat Files
    - Non-Microsoft RDBMS (e.g. Postgres)

# Choices of Persistence

# What We've Learned

## Entities

The cornerstone of your website's data

Model these to fully implement the domain

Not limited to Microsoft's data storage platform
